What is HTML?

HTML (HyperText Markup Language) is used to structure and format the content of websites on the World Wide Web. Web Developers use it to create a skeleton of modern websites and web apps.

In simple words, HTML is the primary building block to create and structure website content.

HyperText

HyperText is a way of organizing text that allows the reader to easily navigate and access related information. It takes the reader to a different part of the same web page, or to a different web page altogether.

Markup Language

A markup language is a computer language that is used to add structure and formatting to a text document. Markup languages use a system of tags to define the structure and content of a document. These tags are interpreted by a program or application to display the document in a specific way.
